Internet – Climate Killer or Climate Saver?

OFFIS-Institut für Information Technology Prof. Dr.-Ing. Wolfgang Nebel (c) OFFIS 2009 - www.offis.de

Energy Consumption, Climate Protection, Costs

- ▶ **Power Consumption of ICT (End Devices and Infrastructure) in Germany** (Source: Cremer et al. 2003)
 - ▶ 2001: 38 TWh (8% of power consumption)
 - ▶ Compared to 10.7 TWh generated from wind energy (Source: Bundesverband Windenergie)
 - ▶ 2010: 55 TWh (11% of power consumption)
- ▶ **CO₂-Emissions 2004 in Germany**
 - ▶ ICT: 28 Mio. t CO₂ (due to power consumption)
 - ▶ Compared to complete aircraft traffic of 22 Mio. t CO₂
- ▶ **Increase especially in ICT-Infrastructure** (UMTS-Network, Servers, Routers etc.)
 - ▶ The highest electricity consumers are data centers
 - ▶ Servers: 123 TWh in 2005 relate to 12 nuclear power plants worldwide
 - ▶ 80% of all servers are located in data centers

OFFIS-Institut für Information Technology Prof. Dr.-Ing. Wolfgang Nebel (c) OFFIS 2009 - www.offis.de

The IT Emission Race

Region/Category	Approx. M tons CO ₂
Puerto Rico	20
Sweden	40
US Servers	60
Hong Kong	80
Greece	100
Belgium	120
All servers (2005)	180
Poland	250
All servers (2010)	350

Energy Consumption of ICT in Germany

Year	TV	Server, office	Audio stationary	Infrastructure mobile communication	ICT-infrastructure in private homes	Total (GWh)
2001	~10000	~10000	~10000	~10000	~10000	~50000
2005	~10000	~10000	~10000	~10000	~10000	~60000
2010	~10000	~10000	~10000	~10000	~10000	~70000

Source: Bordenstep 2007/Cremer et al. 2003

OFFIS-Institut für Information Technology Prof. Dr.-Ing. Wolfgang Nebel (c) OFFIS 2009 - www.offis.de

Telepresence or Business Trip?

- ▶ Energy consumed per GB transferred: ~ 1.1 kWh
- ▶ Data volume per h video presence @ 1 Mb/s ~ 3.6 GB
- ▶ Energy hour tele presence ~ 3.9 kWh
- ▶ CO₂ per hour telepresence (intercontinental) ~ 2.45 kg
- ▶ CO₂ footprint of roundtrip Frankfurt – New York 4,168 kg

Source: TU-Berlin <http://www.cs.tu-berlin.de/~robbe/inf3/inf304>; Luftfransa published comparable figures
Cisco estimated equivalence of 1 intercontinental flight and 98 hour of telepresence. This seems far too low.

OFFIS-Institut für Information Technology Prof. Dr.-Ing. Wolfgang Nebel (c) OFFIS 2009 - www.offis.de

Example Decentralized Management of Energy Grid

- ▶ **Objectives:**
 - ▶ Increase share of renewable energy
 - ▶ Ensure stable energy grid in presence of dispersed providers of (renewable) energy
 - ▶ Cost efficient utilization of energy supply
- ▶ **Means:**
 - ▶ Utilize energy storages, e.g.
 - ▶ Thermo energy: hot water (house, pools), chill (freezer, refrigerator)
 - ▶ Electrical energy: eMobility
 - ▶ Improve match demand and supply of energy by load shifting
- ▶ **ICT Challenges:**
 - ▶ Demand and supply prediction
 - ▶ Communicate pricing information to users and devices
 - ▶ Intelligent metering
 - ▶ Standardize information flow in energy grid
 - ▶ Control means for grid stability

What Demand Causes this Growth?

- ▶ YouTube: 50 PB per month in mid 2007 ~ 7 % US Internet traffic
- ▶ MSN Video Messenger in mid-2007 4 PB per month
- ▶ Second Life more than 11 million users, 50.000 concurrent
- ▶ 1 HD movie is about 10 GB
- ▶ IMAX at Home: 250 GB per movie
- ▶ UHDTV (2016 in Japan): 360 GB per movie
- ▶ 2007: peer to peer file sharing > 500 Mio DVD
- ▶ 2007 Video is ¼ of consumer traffic
- ▶ 2012 Video will be 50% of consumer traffic

Movie Download or Drive?

- ▶ Energy consumed per GB transferred: ~ 1 kWh
- ▶ Energy per DVD (movie of 4 GB) ~ 3.8 kWh
- ▶ Energy per BlueRay Disk (HDTV movie 25 GB) ~ 24.5 kWh
- ▶ CO₂ per DVD transfer ~ 2.5 kg
- ▶ That allows to drive with EU 2012 car (120 g/km) 20 km

OFFIS-Institut für Information Technology Prof. Dr.-Ing. Wolfgang Nebel (c) OFFIS 2009 - www.offis.de

OFFIS
Institut für Information Technology

Putting it together

- ▶ Global increase of CO₂ emission: 2 % per year
- ▶ Increase of Data Centre CO₂ emission (BAU) 15.8 % per year
- ▶ Increase in Internet traffic 46 % per year

CO ₂ [Mio t]	2005	2010	2015	2020
Global	26437	30400	33700	36700
Data Centres	49	102	212	441
Data Traffic*	9	63	416	2759

* Under the unrealistic assumption of no efficiency improvements

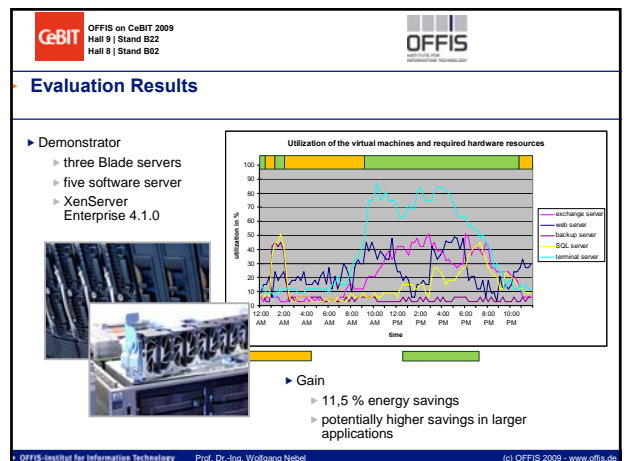

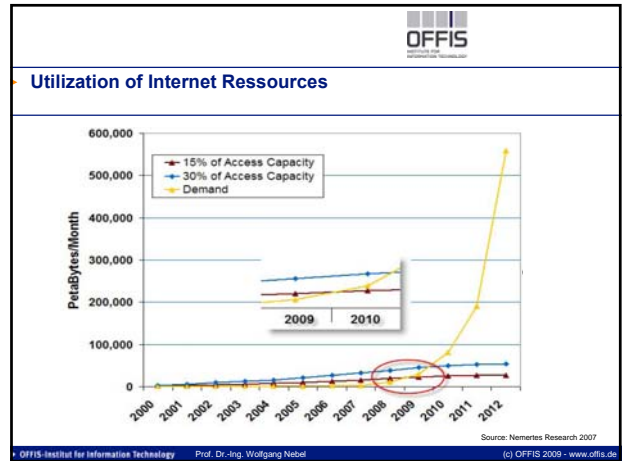

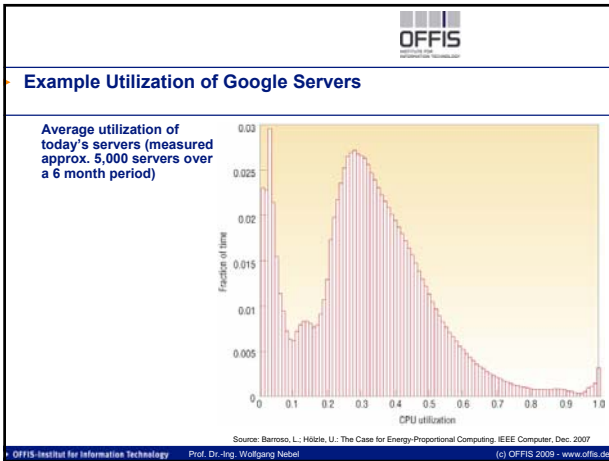

- ▶ Data Centres and data traffic could account for more than 8% of CO₂ emissions under a business as usual scenario compared to 0.2% in 2005.
- ▶ Data traffic will surpass data centres in CO₂ emission.
- ▶ This does not include local office equipment and consumer electronics.

So far the Symptoms – Now the Diagnosis

OFFIS-Institut für Information Technology Prof. Dr.-Ing. Wolfgang Nebel (c) OFFIS 2009 - www.offis.de

Example Powermanagement of PC and Notebook

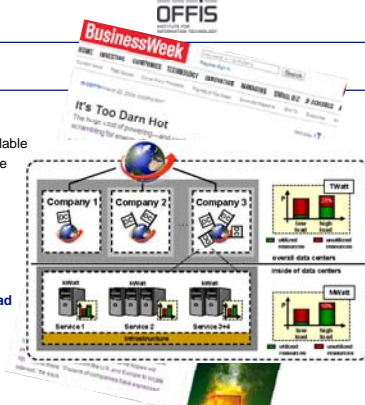

- Problems of the Present Timeout Based Power Managements**
 - Idea: After some idle-time, the user is considered to be absent → turn off device (e.g. display)
 - Error-prone (e.g. while user reads)
 - The chosen balance between saving energy and annoyance often is to the disadvantage of energy saving
- Solution: Intelligent Power Management**
 - Adapt the power management to the pattern of use
 - Include learning and adaptation

OFFIS-Institut für Information Technology Prof. Dr.-Ing. Wolfgang Nebel (c) OFFIS 2009 - www.offis.de

Relocating Data Centres

- An option iff**
 - power efficient data link available
 - renewable energy is available
 - cooling could be free
 - A cold and windy place!
- Opens opportunity to global load management!**
 - Between data centers
 - Between providers

Guideline EU
presented Nov 19th 2008

OFFIS-Institut für Information Technology Prof. Dr.-Ing. Wolfgang Nebel (c) OFFIS 2009 - www.offis.de

Guidelines by ITU

- Next Generation Networks (NGN):** The logical goal is the coming together of existing networks (fixed, mobile, Internet, broadcast etc.) into a unitary network architecture.
- Technical advancements:**
 - Multiple power modes
 - Optical broadband access
 - Using only sufficient power to meet transport rate requirements
 - Reduction in the number of switching centres
- Behavioural advancements:**
 - Teleconferencing, teleworking, e-learning, e-shopping
 - Virtual worlds: virtual newspapers, magazines, books etc.

Conclusion (1)

- ICT offers outstanding opportunities to reduce CO₂ emissions.**
 - E.g. Japan could almost meet their Kyoto commitments through ICT means.
- ICT itself consumes substantial energy and is responsible for**
 - 2% of CO₂ emissions,
 - the same as the entire air traffic, more than wind energy can provide, ...
- Very good prerequisites for applying new technologies now, since**
 - environmentally and economically necessary,
 - technically required and feasible.

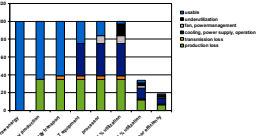

OFFIS-Institut für Information Technology Prof. Dr.-Ing. Wolfgang Nebel (c) OFFIS 2009 - www.offis.de

Conclusion (3C2)

► Actions

- Raise cost awareness in decision makers (data centers and Telcos)
- "Best practice" information on low hanging fruits
 - consolidation/virtualization,
 - increase utilization/load- and power management,
 - cooling.
- Roadmap to coordinate suppliers towards market launch
- Flagship initiatives (improving the state-of-the-art)
- Energy-labels for the consumers market
- Research initiatives for new holistic and sustainable solutions
